Primary Examiner—Ronald L. Frinks

[57] **ABSTRACT**

A posterior chamber lens implant comprising a centrally positioned lens body having a pair of opposing loop members extending therefrom with the loop members cooperating to extend completely around the lens body. One of the loop members extends from the lens body at three o'clock and extends around the lens body in a counterclockwise manner and is connected to the lens body at approximately three o'clock. The other loop member extends from the lens body at approximately nine o'clock and extends around the lens body in a clockwise manner and has its other end secured to the lens body at approximately nine o'clock. The relationship of the loop members and the lens body permits the loop members to be compressed towards the lens body to enable the implant to be inserted in the eye.
